Introducing a Reverse Phase HPLC Column independent of pH. Now there's a Reverse Phase Resin column designed for sample separations where pH and salt concentrations are of concern. Hamilton's new PRP-1 is ideal for separating polar, semi-polar, and some neutral compounds by HPLC. And its hydrophobic qualities are equal or superior to any C^{18} silica.

Hamilton's PRP-1 is filled with highly rigid 10 um macroporous resin spheres which can selectively adsorb both ionic and neutral solute species. These non-swelling adsorbents operate over a significantly broader pH range than conventional alkyl functional silicas. And their physical stability precludes the need for guard columns or concern for damage to the packing.

The PRP-1's extended pH range accomplished without the use of expensive "Pic" reagents provides a powerful tool in qualitative chromatographic analysis, because protic species can be separated at different pH extremes.
